**Program: Bachelor Data Science and Artificial Intelligence****Course code:** KEN3241**Examiners:** Dibenedetto Domenica**Date/time:** Friday 02-02-2024, 13h00-15h00**Format:** Closed book exam**Allowed aids:** Calculator from the DACS list of allowed calculators and the given formula sheet of basic quantum operators**Instructions to students:**

- The exam consists of 5 questions on 12 pages.
- Fill in your name and student ID number on the cover page and tick the corresponding numerals of your student number in the table (top right cover page).
- Answer every question in the reserved space below the question. **Do not write outside the reserved space or on the back of pages, this will not be scanned and will NOT be graded!** As a last resort if you run out of space, use the extra answer space at the end of the exam.
- *In no circumstance write on the QR code at the bottom of the page!*
- Ensure that you properly motivate your answers.
- Only use black or dark blue pens, and write in a readable way. Do not use pencils.
- Answers that cannot be read easily cannot be graded and may therefore lower your grade.
- If you think a question is ambiguous, or even erroneous, and you cannot ask during the exam to clarify this, explain this in detail in the space reserved for the answer to the question.
- If you have not registered for the exam, your answers will not be graded, and thus handled as invalid.
- You are not allowed to have a communication device within your reach, nor to wear or use a watch.
- You have to return all pages of the exam. You are not allowed to take any sheets, even blank, home.
- Success!

**Exercise 1**

- 10p **1a** Is there an experiment (measurement) where you can distinguish with absolute certainty whether the qbit is in the state (1) or (2)?

State (1):  $|0\rangle$

State (2):  $\frac{3}{5}|0\rangle + \frac{4}{5}|1\rangle$

Justify your answer.

- 10p **1b** Considering state (2) what are the probabilities that we will measure  $|+\rangle$  or  $|-\rangle$  if we measure in the  $|+\rangle, |-\rangle$  basis?

**Exercise 2**

20p **2** Explain why the classical copy of a quantum state is not possible (no-cloning theorem).

**Exercise 3**

- 20p **3** Using shared EPR-pairs, Alice and Bob can communicate with each other instantaneously (so faster than light). Is this true or false? Justify your answer.

**Exercise 4**

10p **4a** Which quantum state do we get if we apply  $(H \otimes I)CNOT$  to

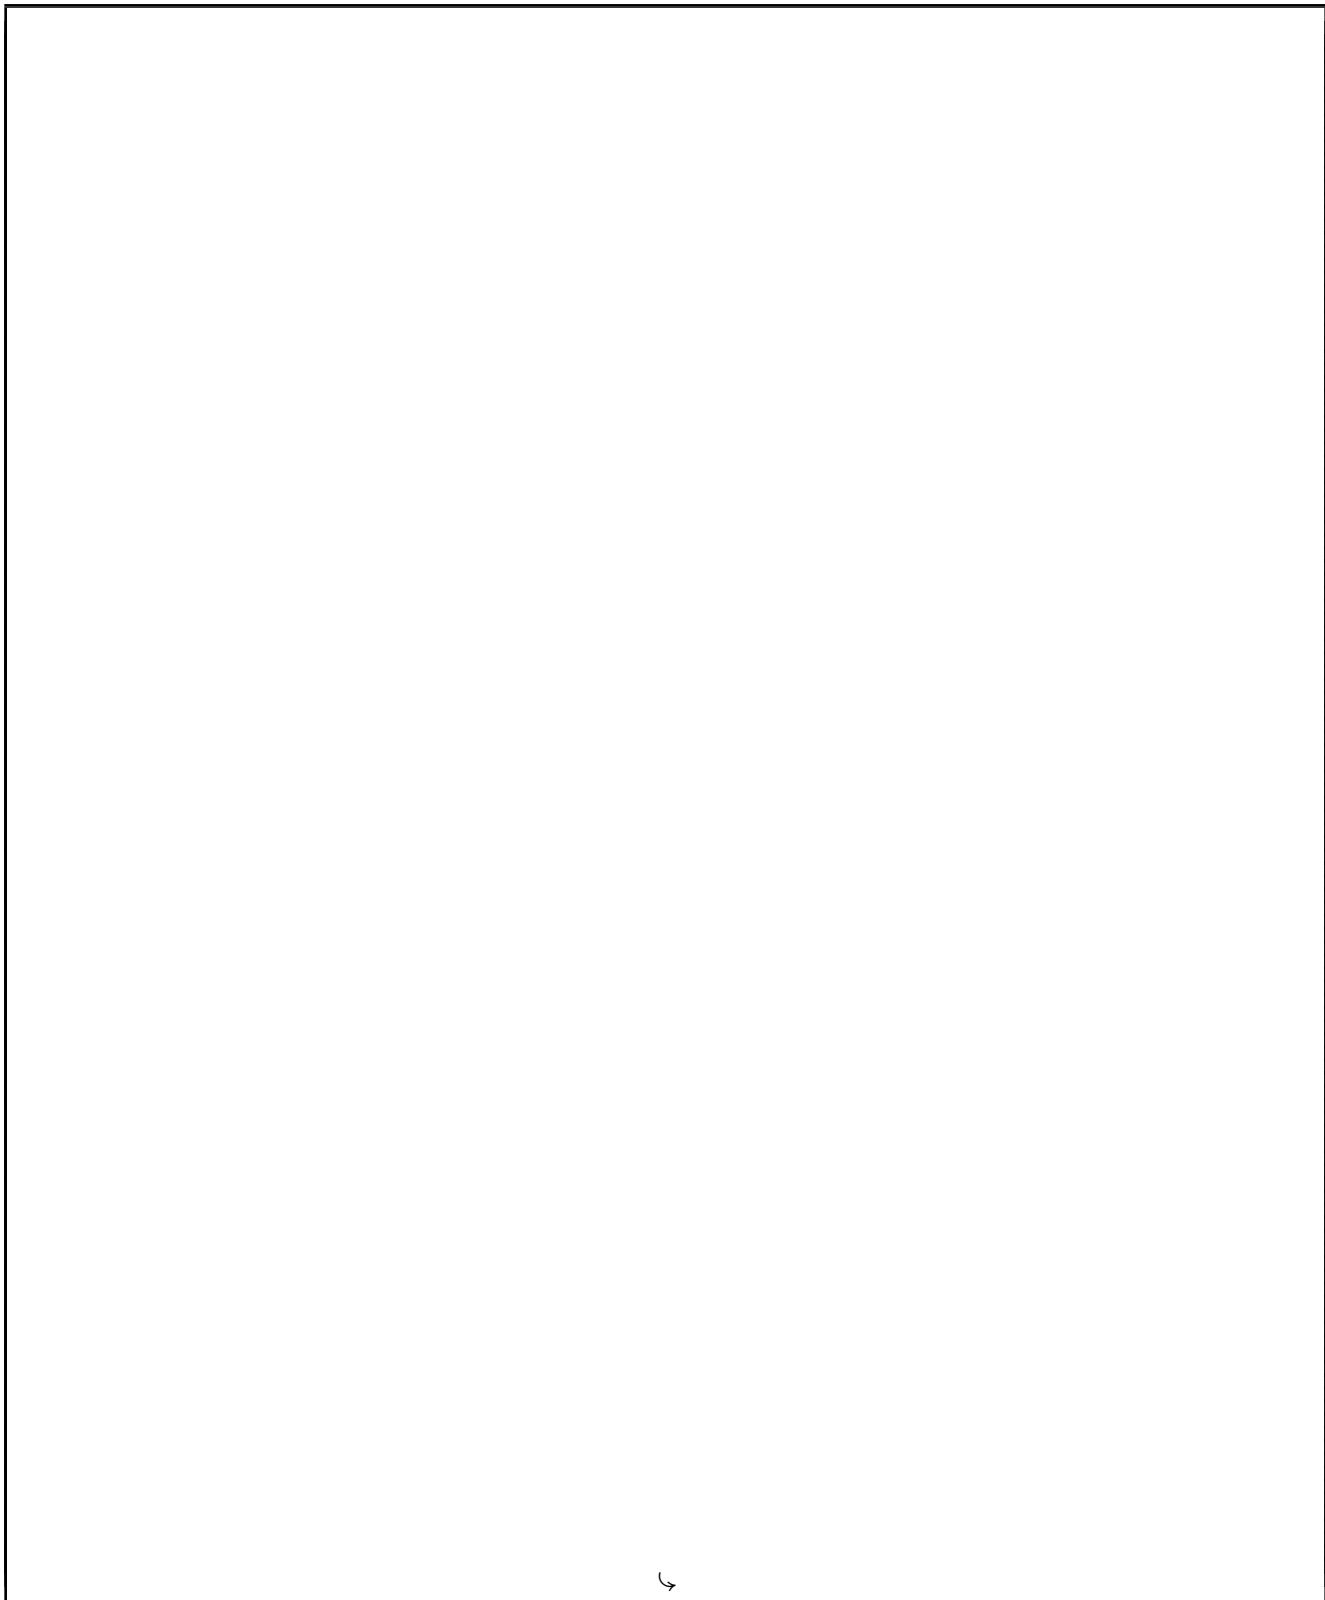

$$\sqrt{\frac{1}{3}}|00\rangle + \sqrt{\frac{2}{3}}|11\rangle ?$$

Here  $I$  is the 1-qubit identity operation,  $H$  is the one-qubit Hadamard, and  $CNOT$  is the 2-qubit controlled-not operation with the first (=leftmost) qubit being the control.

10p **4b** What is the probability of seeing  $|11\rangle$  if we measure the resulting state in the computational basis?

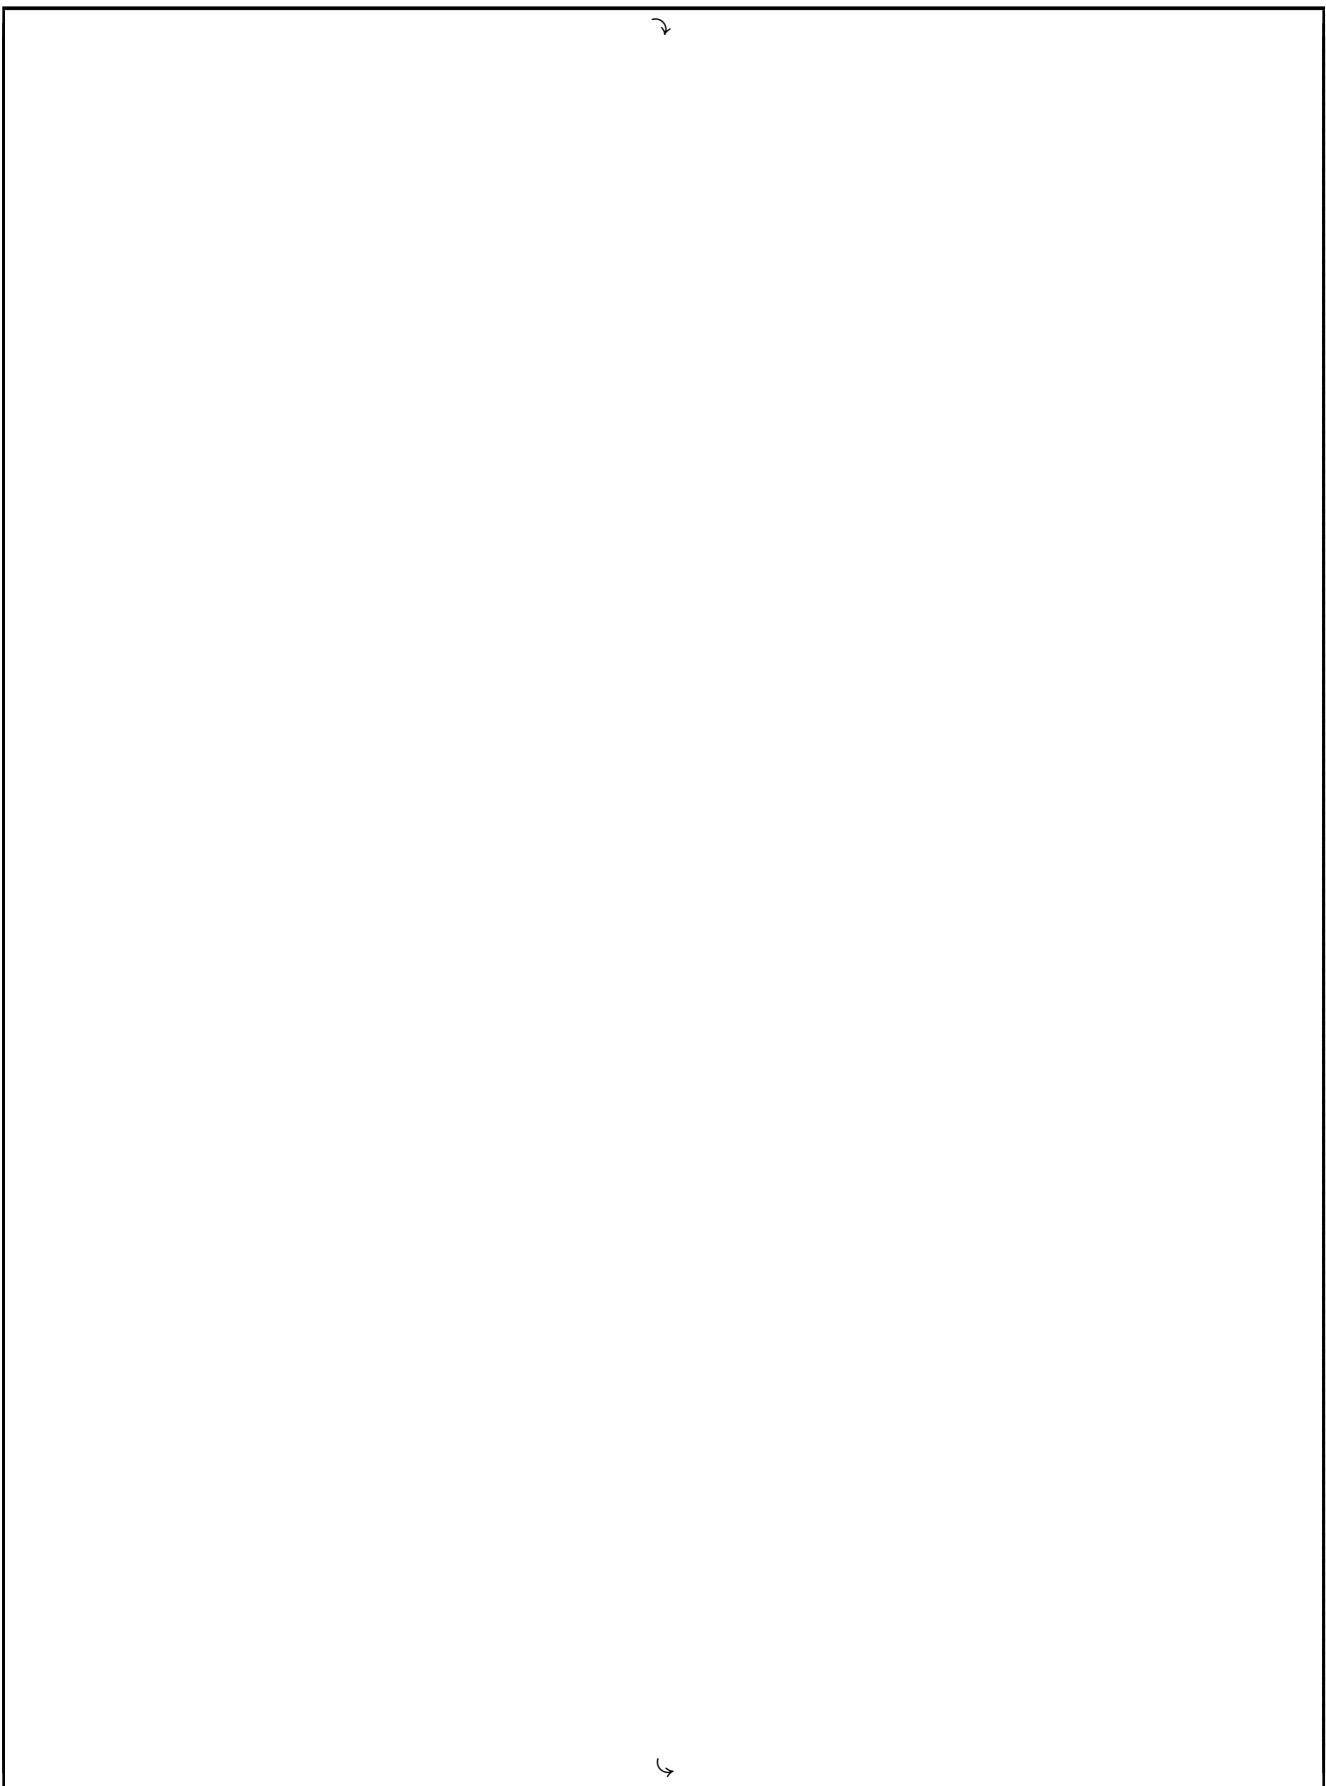

**Exercise 5**

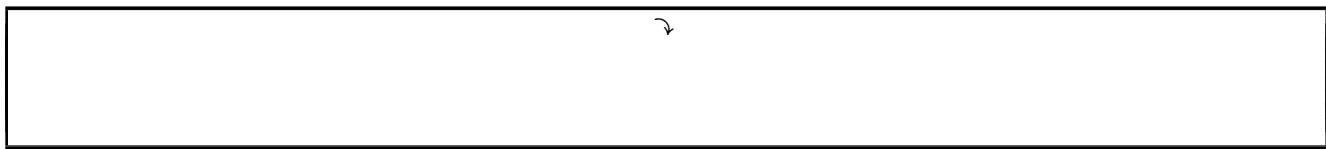

- 20p **5** Show that unitaries cannot “delete” information: there is no one-qubit unitary  $U$  that maps  $|\varphi\rangle \rightarrow |0\rangle$  for every one-qubit state  $|\varphi\rangle$ .

**Additional space****6**

A large, empty rectangular box with a thin black border, occupying most of the page below the header and section title. It is intended for handwritten or printed additional information.
